

robots.txt AI Question & Answer Workflow

n8n workflow documentation — simple user language

1. Workflow Overview

Workflow: When clicking Execute workflow → Download File → Extract from File → Basic LLM Chain → Groq Chat Model → Answer

2. Purpose

This workflow allows a user to provide a **robots.txt** file and ask questions about the URLs and rules inside the file. The AI reads the file and gives a simple answer based only on the information available in it.

3. Input

The main input is a **robots.txt** file. The workflow reads the text inside the file before sending it to the AI model.

```
User-agent: *  
Disallow: /private/  
Disallow: /admin/  
  
Sitemap: https://example.com/sitemap.xml
```

4. Workflow Steps

Step 1 – When clicking Execute workflow

Starts the n8n workflow manually and runs the file-processing steps.

Step 2 – Download File

Gets the robots.txt file and passes it to the next step.

Step 3 – Extract from File

Reads the text inside robots.txt and makes the content available to the AI.

Step 4 – Basic LLM Chain

Takes the user's question and the extracted robots.txt content, then asks the AI to answer the question.

Step 5 – Groq Chat Model

Processes the robots.txt content and generates the final answer.

5. Example Questions

Question type	Example
Sitemap	Is a sitemap included?
Sitemap URL	What is the sitemap URL?
Disallowed URLs	Which URLs are disallowed?
Specific URL	Is /admin/ disallowed?
User-agent	What rules apply to Googlebot?
Allow rule	Which URLs are explicitly allowed?
Blocking	Is the entire website blocked?
SEO review	Are there any obvious crawling issues?

6. Suggested LLM Prompt

You are a Senior QA Engineer reviewing a robots.txt file.

Use only the robots.txt content provided to answer the user's question.

User question:
{{user question}}

robots.txt content:
{{robots.txt content}}

Please:

- Give a clear and simple answer.
- Mention the relevant User-agent, Allow, Disallow or Sitemap rule.
- If the requested information is not present in the file, say that it is not available.
- Do not make assumptions about URLs that are not present in the file.

7. Example End-to-End Scenario

Input file:

```
User-agent: *
Disallow: /admin/
Disallow: /private/

User-agent: Googlebot
Allow: /articles/

Sitemap: https://example.com/sitemap.xml
```

User question: Is /admin/ disallowed?

AI answer: Yes. /admin/ is disallowed for User-agent: *.

User question: What is the sitemap URL?

AI answer: The sitemap URL is https://example.com/sitemap.xml.

8. Important Behaviour

The AI should answer **only from the uploaded robots.txt file**. If the user asks something that cannot be determined from the file, the AI should clearly say that the information cannot be determined from robots.txt.

9. Expected Output

The final answer should be simple, clear, relevant to the user's question, and based on the uploaded file.

Question:
Is the sitemap included?

Answer:
Yes. A sitemap is included in the robots.txt file.

Sitemap:
<https://example.com/sitemap.xml>

10. Future Improvements

- Use a Chat Trigger so users can upload the file and ask questions directly.
- Allow multiple questions about the same robots.txt file.
- Add automated PASS/FAIL QA checks.
- Detect Disallow: / and other potentially critical rules.
- Check for missing sitemap information.
- Identify potentially conflicting rules.
- Compare two robots.txt files.
- Generate a QA report.
- Create a Jira ticket when a critical issue is found.

11. Summary

User uploads robots.txt → n8n extracts the text → user asks a question → Groq LLM reviews the file → workflow returns an answer.
