

Promptathone Home Assignment

1, Scenario Name

- Search functionality

2. Weak prompt

- Test the search feature.

3. What i feel is missing

- No application (e.g., e-commerce, banking, healthcare)
- Search scope (products, users, orders, etc.)
- Functional requirements
- Filters and sorting
- Valid/invalid inputs
- Empty and boundary cases
- Expected output format (test cases, checklist, BDD, etc.)

4. ICEPOT Instruction

I – Instruction

Generate comprehensive test cases for the search functionality.

C – Context

The application is an e-commerce website. The search feature allows users to search for products using keywords, apply filters, sort results, and view paginated search results.

E – Example

Example Test Case: Verify that searching for "iPhone" displays all matching products with relevant results.

P – Persona

Act as a Senior QA Automation Engineer with expertise in functional, negative, boundary, usability, accessibility, and performance testing.

O – Output Format

Provide the output in a table with the following columns:

- Test Case ID
- Scenario
- Preconditions
- Steps

- Test Data
- Expected Result
- Priority
- Severity

T – Tone

Technical, clear, and professional for QA Engineers.

5. Rewritten Prompt

"Act as a Senior QA Automation Engineer. Generate comprehensive functional, boundary, negative, usability, accessibility, and performance test cases for the product search functionality of an e-commerce website. Cover keyword search, partial matches, special characters, filters, sorting, pagination, empty and invalid inputs, no-result scenarios, search suggestions and cross-browser compatibility. Include one sample test case as a reference and present all test cases in a table with Test Case ID, Scenario, Preconditions, Steps, Test Data, Expected Result, Priority, and Severity. Use a clear, technical, and professional tone."

6.Observations (OBS)

The improved prompt provides clear context, specifies the AI's role, defines the expected output format, and includes detailed testing scenarios, resulting in more complete, structured, and relevant test cases.

Scenario 02

1. Scenario Name

File Upload Functionality

2. Weak Prompt

Generate test cases for file upload.

3. What I Feel is Missing

Application/domain (e.g., document management, banking, healthcare)

Supported and unsupported file types (PDF, JPG, DOCX, EXE, etc.)

Minimum and maximum file size limits

Single vs. multiple file upload

Success and failure criteria

Empty, duplicate, and corrupted file scenarios

Security testing (malicious files, executable files, script injection, viruses)

Expected output format (test cases, checklist, BDD, etc.)

4. ICEPOT instruction

I – Instruction

- Generate comprehensive test cases for the file upload functionality.

C – Context

- The application allows users to upload files (PDF, JPG, PNG, DOCX) through a web interface. The maximum file size is 10 MB, and only supported file types are accepted.

E – Example

- Example Test Case: Verify that a user can successfully upload a valid PDF file (2 MB) and receives a success confirmation message.

P – Persona

- Act as a Senior QA Automation Engineer with expertise in functional, negative, boundary, security, usability, and performance testing.

O – Output Format

- Provide the output in a table with:
- Test Case ID
- Scenario
- Preconditions
- Steps
- Test Data
- Expected Result
- Priority
- Severity

T – Tone

- Technical, clear, and professional for QA Engineers.

Rewritten Prompt

- "Act as a Senior QA Automation Engineer. Generate comprehensive functional, boundary, negative, security, usability, and performance test cases for the file upload functionality of a web application. Cover supported and unsupported file types, minimum and maximum file size limits, empty, duplicate, and corrupted file uploads, multiple file uploads, upload cancellation, network interruptions, success and failure scenarios, malicious file uploads (e.g., executable files, scripts, viruses), validation messages, upload progress, and response time. Present the results in a table with Test Case ID, Scenario, Preconditions, Steps, Test Data, Expected Result, Priority, and Severity. Use a clear, technical, and professional tone."

OBS – Observation

- The improved prompt provides sufficient context, file upload constraints, security considerations, edge cases, and a defined output format, resulting in more comprehensive, structured, and practical test cases.
-

Scenario 03

1. Scenario Name

- API Testing – User Registration

2. Weak Prompt

- "Write API test cases for user registration."

3. What I Feel is Missing

- API specification (REST/GraphQL)
- HTTP method (POST, PUT, etc.)
- Endpoint URL
- Request headers (Content-Type, Authorization)
- Request body structure and mandatory fields
- Expected response body
- HTTP status codes to validate (200, 201, 400, 401, 409, 500)
- Positive, negative, boundary, and security scenarios
- Authentication/authorization requirements
- API testing tool context (Postman, RestAssured, Swagger)

- Expected output format (test cases, checklist, BDD, etc.)

4. ICEPOT Instruction

I – Instruction

- Generate comprehensive API test cases for the user registration endpoint.

C – Context

- The application exposes a REST API for user registration using the POST method. Users submit registration details (name, email, password, phone number), and the API returns appropriate success or error responses. Testing will be performed using Postman.

E – Example

- Example Test Case: Verify that sending a valid POST request with all mandatory fields returns HTTP 201 Created and a success message with the newly created user ID.

P – Persona

- Act as a Senior QA Automation Engineer with expertise in API, functional, boundary, negative, security, and performance testing.

O – Output Format

Provide the output in a table with:

- Test Case ID
- Scenario
- Preconditions
- HTTP Method
- Endpoint
- Request Data
- Expected Status Code
- Expected Response
- Priority
- Severity

T – Tone

- Technical, clear, and professional for QA Engineers.

 **Rewritten Prompt**

"Act as a Senior QA Automation Engineer. Generate comprehensive API test cases for the REST user registration endpoint using the POST method. Cover request header validation, mandatory and optional fields, valid and invalid request payloads, missing fields, duplicate email, invalid email format, password validation, boundary value testing, authentication and authorization (if applicable), HTTP status codes (201, 400, 401, 403, 409, 500), response body validation, error messages, response time (<2 seconds), security testing (SQL injection, XSS, malicious payloads), and API testing using Postman. Present the results in a table with Test Case ID, Scenario, Preconditions, HTTP Method, Endpoint, Request Data, Expected Status Code, Expected Response, Priority, and Severity. Use a clear, technical, and professional tone."

OBS – Observation

The improved prompt provides complete API context, including the HTTP method, request and response structure, expected status codes, security considerations, testing tool, and output format. This enables the AI to generate more accurate, structured, and production-ready API test cases.
