Phase 2 Week-13 Day-1 Home assignment
Application integration to Deepeval metrics

Test-Case Quality Gate and Publishing Workflow

Enhance the existing test-case generator application by adding a quality-validation and approval workflow.

Evaluate every generated test case using these three DeepEval metrics:

- Faithfulness: Score must be ≥ 0.75
- Contextual Recall: Score must be ≥ 0.75
- Hallucination: Score must be ≤ 0.25, preferably 0

Add a toggle to support two modes:

1. Manual Mode

- Display all three metric scores in the UI.
- Provide Approve and Reject buttons.
- When the user approves the test cases, store them in MongoDB and create them in Jira.
- When the user rejects them, do not publish or store the test cases.

2. Automation Mode

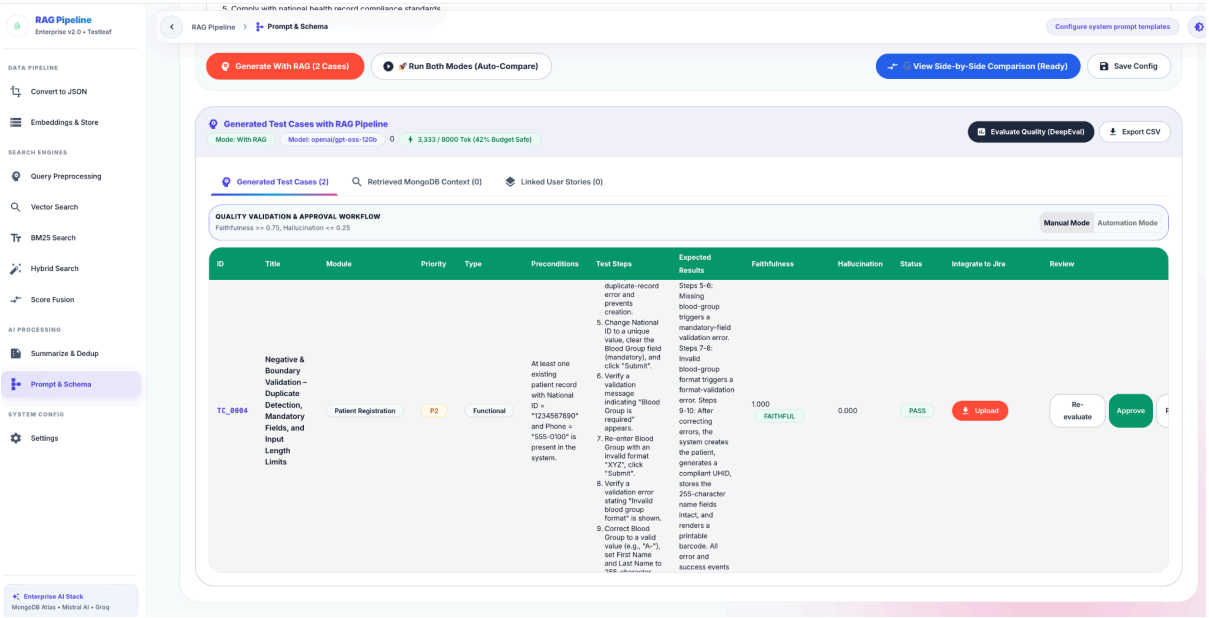

- Automatically validate the generated test cases against the configured thresholds.
- Publish them to MongoDB and Jira only when all three metrics pass.
- If any metric fails, stop the publishing process and display the failure reason.

Prompt:

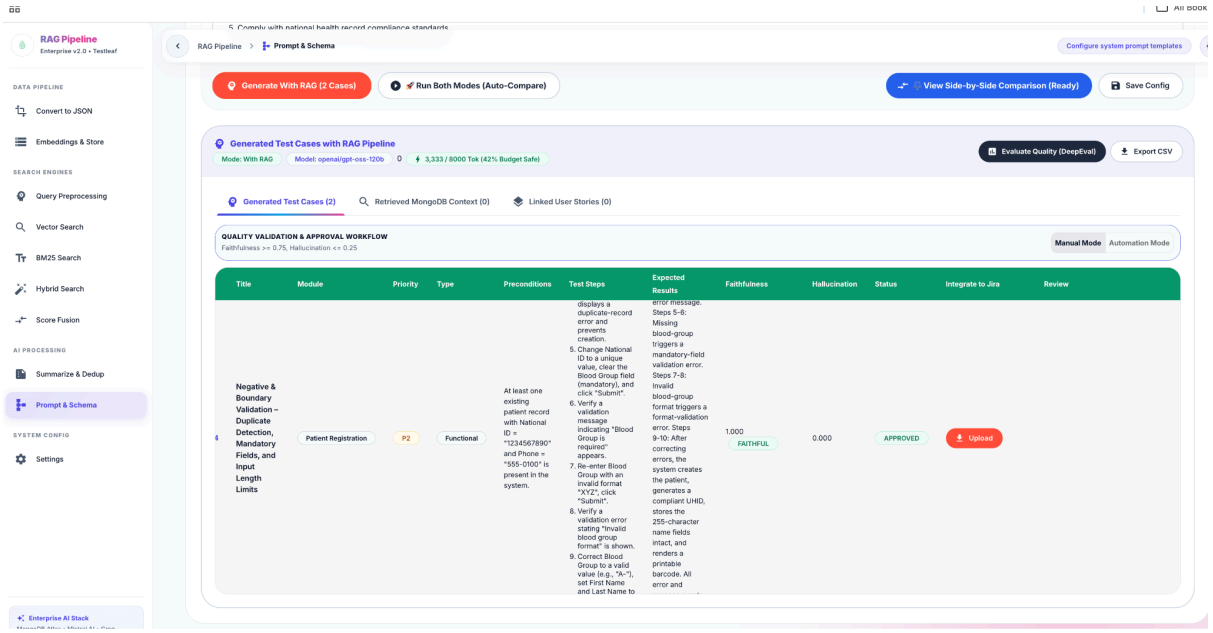

Act as a ai developer ,Enhance the existing test-case generator UI with a Quality Validation and Approval workflow. Add Manual/Automatic mode toggle. Evaluate every generated test case using DeepEval: Faithfulness ≥ 0.75, Contextual Recall ≥ 0.75, and Hallucination ≤ 0.25. Display the three scores and overall PASS/FAIL status. In Manual Mode, provide Approve and Reject buttons; if it gets Approve ,stores the test case in MongoDB and creates it in Jira, When the user rejects them, do not

publish or store the test cases. first only develope Manual mode functionality
[stricly]don't change any other ui functionality or logic
this workflow should be implimented in prompt and schema tab located in left side panel , once user has given the userstory in , it should generate the selected number of test cases showing in table format , extend the table for all three marix and evaluate quality of test case . check the images provided for how this need to look like in ui

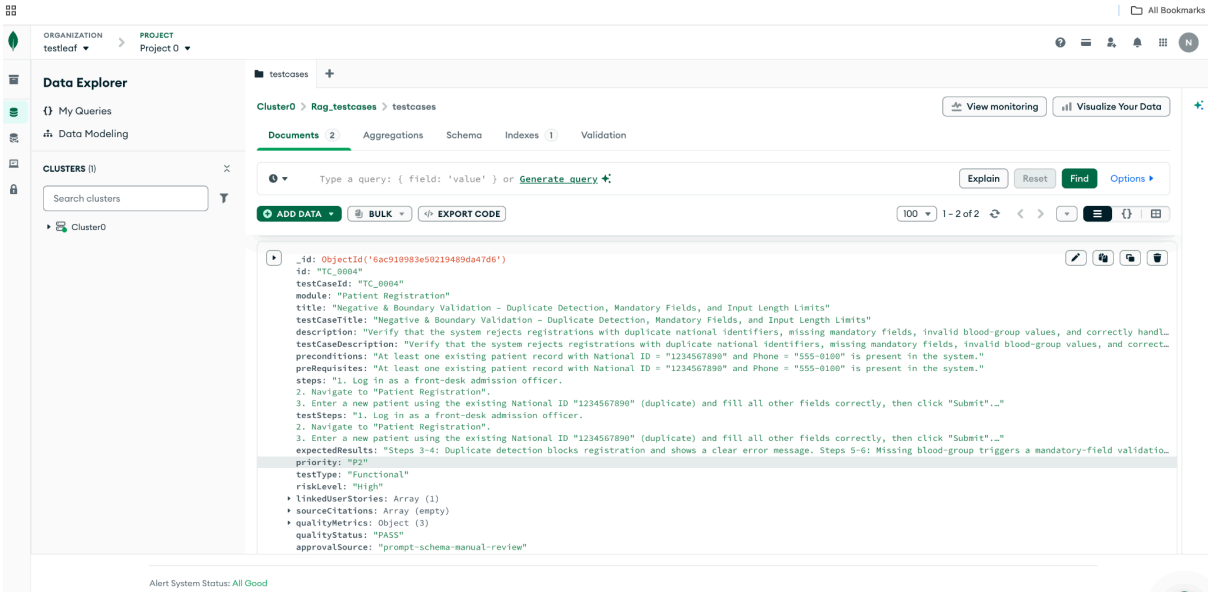

- **Generate the test cases from User story**

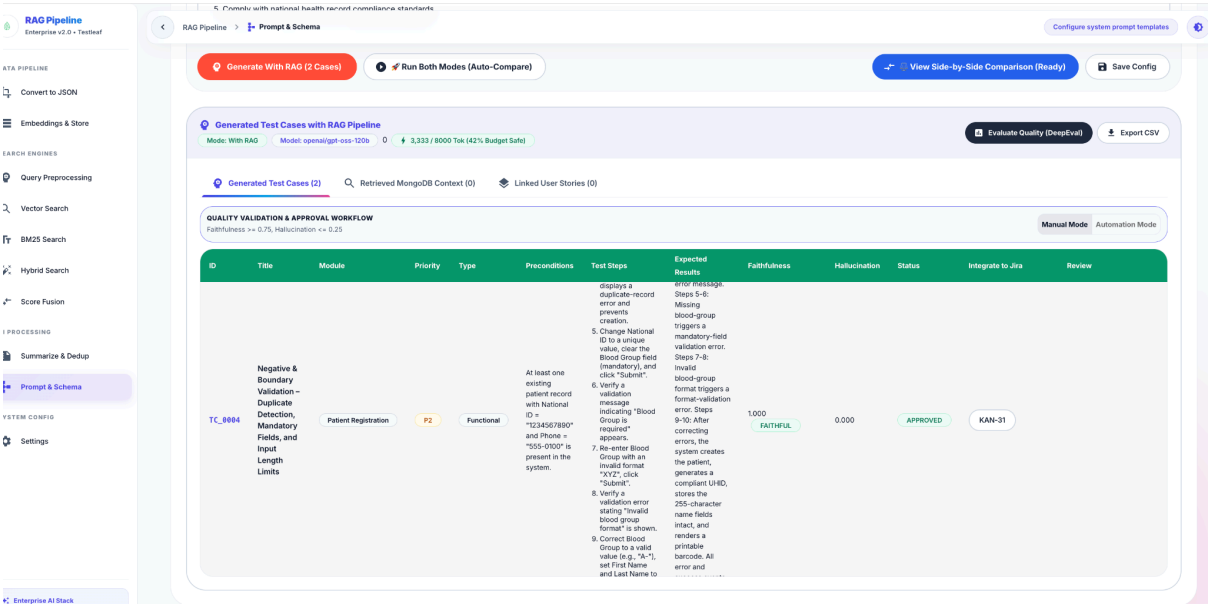

- **Once both metrics passed approve the test case to ingest in MongoDb**

- **Ingested to MongoDb**

- **Upload the pass test case to Jira**

- **Jira ingestion verified**
